CSUPErfamily: hepatitis C virus genome polyprotein
CSUPERIALLY: papsid protein: envelope protein: glycoprotein; hydrolase; nonstruc
E:1-115/Product: capsid protein C *status predicted <CPC>
E:116-191/Product: envelope protein M *status predicted <MEE>
E:192-1894/Product: major envelope protein M *status predicted <MEE>
E:330-733/Product: nonstructural protein NS1 *status predicted <NS1>
E:101-1619/Product: nonstructural protein NS2 *status predicted <NS2>
E:101-1619/Product: hepatolylrin *status predicted <NS2>
E:1214-1211/Region: nucleotide-binding motif A (P-loop)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                genome polyprotein - hepatitis C virus (strain HC-J8)
N;Contains: capsid protein C; envelope protein M; hepacivirin (EC 3.4.21.98) (nonstrested in Ns4a: nonstructural protein NS4a: nonstructural protein NS5
C;Species: hepatitis C virus
C;Species: hepatitis C virus
C;Date: 31-Dec-1992 #sequence_revision 31-Dec-1992 #text_change 19-Jan-2001
C;Accession: A40250; pp0397; pp0559

```
The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. The protein produced from this sequence contains the alpha-helix0-1 variant.
                                                                                                                                                                                                                                                                                                                                  Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C

The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. The protein produced from this sequence contains the alpha-helix0-1 variant. Claim 26; Fig 14; 66pp; English.

The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and Niver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. The protein produced from this sequence contains the alpha-helix0-1 variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SerProLysGlyProValileGlnMetTyrThrAsnValAspLysAspLeuValGlyTrp 100

These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify protease and protease:inhibitors complexes. The protein produced from this sequence contains the alpha-helixO wild-type sequence.

                                                                                        a
                                                                                                                                                                                                                                                                                                                   fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. The protein produced from this sequence contains the alpha-helix0-1 variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is the coding sequence for a mutated version of a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9
                                                                                                                                                                                                                                      The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. The protein produced from this sequence contains the alpha-helix0-7 variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is the coding sequence for a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as

chimeric Hepatitis C virus (HCV)-pestivirus genome. The construct comprises a pestivirus genome where a Npro pestivirus protease gene is replaced with a gene encoding a functional HCV NS3 protease. Furthermore, each junction site recognised by the Npro protease is replaced with a junction site recognised by the HCV NS3 protease. The construct is useful for screening compounds that inhibit HCV in vivo by inhibiting HCV protease, where screening may be in cell culture or in an animal model. The present sequence is a chimmeric clone of BVDV (bovine viral diarrhea virus)/HCV NS3-wt, which was used to illustrate the present invention. present invention relates to a nucleic acid construct encoding a

This invention relates to a novel synthetic viral prototoxophore domains specific for a viral enzyme. This prototoxophore may be bound and and specific for a viral enzyme. This prototoxophore may be bound and modified by the viral enzyme thus converting it to a toxophore. Also disclosed in the invention is a method for enhancing the anti-viral entry of its susceptible to infection, with a cell, coffected with a virus or is susceptible to infection, with a prototoxophore. The invention further comprises an assay to identify a nati-viral agents, comprising contacting an infected cell with a candidate agent and comparing the ability of the agent to inhibit the growth or infectivity of the virus in the cell. The prototoxophores of the invention may have viruside or antitumour activity. The prototoxophores of the invention may be useful for reducing or inhibiting viral infectivity, by contacting a cell (e.g. lymphocyte, onerve cell, connective tissue cell, muscle cell or hepotocyte) which is infected with a virus or is susceptible to infection with a virus, with a cadapted to long term continuous culture or isolated from a subject. The prototoxophore is also useful for ameliorating the severity of a viral infection in a subject, where the virus is selected from human immunodeficiency virus (Hist), herpes simplex virus (HSV), rhinovirus and hepatitis virus, by administering an effective amount of the prototoxophore to the subject. The prototoxophores of the invention are antiviral prototoxophore associated DNA sequence represents an antiviral prototoxophore associated DNA sequence, this sequence is a networthy and received by administering and prototoxophore is a recombinant NASI/NS4 fusion protein and antiviral prototoxophore is a recombinant prototoxophore is a re
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    has

```
It is a double-stranded nucleotide sequence of the open reading frame (ORF) (tag a) extending through clones 14i, 11b, 7f, 7e, 8h 33c, 40b, 31b, 35, 36, 11, 32, 33b, 25c, 14c, 8f, 31f, 31g and 39c of hepatitis C virus (HCV) cDNA. In creating the composite sequence the following heterogeneities were considered. Clone 33c contains a sequence of 800 base pairs which overlaps the conneas 40b and 37c. In clone 31c, as well as in 5 other overlapping clones, nucleotide #789 is a G. However, in clone 37b the corresponding nucleotide is an A. This chertogenity may have important ramifications for protein folding. Concloses the corresponding residue in clone 7e and in 3 other overlapping clones is an A. Therefore the residue in the 7e and in 3 other overlapping clones is an A. Therefore the residue in the 3 other overlapping clones is an A. Therefore the residue in clone 31f and in 2 other overlapping clones is an A. The 3' terminal sequence of clone 31f is sequence of clone 31f is sequence 1 in clone 31f and in 2 other overlapping clones, rather than as TrGC, as is found in the corresponding residue in clone 31f and 2 other overlapping clones is an A. The 3' terminal sequence of clone 31f is sequence corresponding residue in clone 31f and 2 other overlapping clones is an A. The 3' terminal sequence and a rather than a TrGC clones is an A. The 3' terminal clone 31f and 2 other overlapping clones is corresponding sequences in none 31f and 2 other overlapping clones is an A. The 3' terminal residue in clone 31f and 3 other clones is an A. The 3' terminal response to depicted as TA rather than a Connesting and the corresponding sequences in none 31f and 2 other overlapping clones are shown. AAN02097 could be used as a source of clones is TA. Potential cloning artifacts have been omitted and instead overlapping clones are shown. AAN02097 could be used as a source of clones is and passive immunotherany for HCV infarthorm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   927 TIGCIGGCCCCATCACGCCTACGCCCAGCAGACAAGGGGCCTCCTAGGGTGCATAATC 986

encodes antigens which react with antibodies in patients with non-A non-B hepatitis (NANBH). The CDNA can be used to design probes, or to synthesise polypeptides, which are used to diagnose HCV-induced NANBH, or circles antibodies for immnoassay or treatment, or to produce vaccines. It can be used to make oligomeric DNa hybridisation probes to detect the presence of HCV nucleic acids in samples. The polypeptide(s) it encodes could be used as immunoassay reagents and vaccines and to generate antibodies useful in diagnosis and passive immunotherapy for HCV infection/non-A, non-B hepatitis.

                                                                                                                                                                                                                                                                                                                                                                                                                     93
                                                                                                                                                                                                                                                                                      33
It is a double-stranded nucleotide sequence of the open reading frame (ORF) (tag a) extending through clones K9-1 to 15e of hepatitis C virus (HCV) cDNA. It can be used to make oligomeric DNA hybridisation probes to detect the presence of HCV nucleic acids in samples. The polypeptide(s) it encodes could be used as immunoassay reagents and vaccines and to generate antibodies useful in diagnosis and passive immunotherapy for HCV infection/hon-A, non-B hepatitis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      derived by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence shows a composite hepatitis C virus (HCV) cDNA, derived by aligning clones k9-1 through 15e in 5'-3' direction. The cDNA encodes antigens which react with antibodies in patients with non-A non-B hepatitis (NANBH). The cDNA can be used to design probes, or to synthesise polypeptides, which are used to diagnose HCV-induced NANBH, to raise antibodies for immunoassay or treatment, or to produce vaccines. See also AAP90288, and AAN90303-35.

(N.B. This record was resubmitted to correct errors in the sequence.) (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         74 AlaGlyThrArgThrIleAlaSerProLysGlyProVallleGlnMetTyrThrAsnVal

Five-day old seedlings were incubated at 90% RH for 24 hr. Shocts were then harvested, total RNA was prepared, poly(A) RNA was purified, one primary unamplified cDNA library was made, 600000 pfu were in vivo excitsed to give pBluescript SK(-) cDNA phagemids. These steps were performed in the TJ Close laboratory at the University of California, Riverside (Choi, Close, Fenton). Phagemids were plated and plicked at the Clemson University Genomics Institute (UGIS) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or above. For more details on library preparation and sequence analysis see http://www.genome.clemson.edu/projects/barley. To order this clone see http://www.genome.clemson.edu/projects/barley. To order

                                                                                    The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as
                                                                                                                                                                                                                                                                                                                                                                                                                                              TCINGVCWTVYHGAGTRTIASPKGPVTQMYTNVDKDLVGWQAPQGSRSLTPCTCGSSDLY 120

                                                                                                                The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NG3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. This sequence contains the alpha-helixo-1

The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NG3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A (Fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:Inhibitor complexes. This sequence contains the alpha-helix0-1
                                                                                                                                                                                                                                                                                                                                                                              0

The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NG3 and NG4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirthosis, liver failure and liver cancer. The present invention concerns a number of NG3 mutants and NG3-NG4A well as enabling structural studies of the protease and protease: Inhibitor complexes. This sequence contains the alpha-helix0-7
                                                                                                                                                                                                                                                                                                                                                              0

                                                                                                             The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HeV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HVV genome. Inhibitors of the two proteins should be effective as antiviral treatments of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease: Inhibitor complexes. This sequence contains the alpha-helix0-1

The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HVV) NG3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirthosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease: inhibitor complexes. This sequence contains the alpha-helix0-7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 LVTRHADVIPVRRKGDSRGSLLSPRPISYLKGSSGGPLLCPAGHAVGIFRAAVCTRGVAK 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. This sequence contains the alpha-helix0 wild-type sequence.

                                                                                                                                                                                                                                                                                                                                                                     The present sequence is a fusion protein created using the Hepatitis C virus (HCV) N33 and N84A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of MS3 mutents and MS3-MS4 fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:Inhibitor
                                                                                                                                                      Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 MKKKGSVVIVGRINLSGDTAYAQQTRGEEGCQETSQTGRDKNQVEGEVQIVSTATQTFLA

                                                                                                                       The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS3 berine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                                                                               81

The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS3 earlie protease domain. Where the hydrophobic domain of native HCV NS3 earlie protease domain. Where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroacopy. They can also be used for detecting inhibitors by protease activity, the helicase activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               62 CINGVCWTVYHGAGTRTIASPKGPVTQMYTNVDKDLVGWQAPQGSRSLTPCTCGSSDLYL 121

                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A-NS3 complex, and an HCV NS3 earlie protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR specificacypy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.

                                                                                                                                                                                                                                                                                                                  NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS3 earine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminas of the HCV NS4 protease domain. The present soquence erepresents a specifically claimed example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by MR specificacy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3 The covalent NS4A-NS3 complexes are more soluble, stable and active than
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     81
